

WASH N PRESS

App Functional Specification

Resident App & Operations App — Screen-Level Detail, Version 1.0

Table of Contents

1. Purpose

This document specifies the Wash N Press mobile applications at screen level: screen-by-screen field definitions, validations, states, and user flows. It is intended for use directly by UI/UX designers and engineers building the Resident App and the Operations App, and should be read alongside the platform-level Functional Requirements Document and DPR for business context.

Two applications are covered: the Resident App (consumer-facing, iOS/Android) and the Operations App (used by women's-unit operators and, where applicable, hub-model pickup/delivery agents and facility workers).

2. Resident App — Screen-Level Specification

2.1 Screen Flow Overview

- Splash → Location/Society Selection → Sign Up/Login (OTP) → Profile Setup → Home
- Home → Plans → Plan Detail → Payment → Subscription Active
- Home → Schedule Pickup → Slot Selection → Confirmation
- Home → Order Tracking → Order Detail → Rate/Dispute
- Home → Wallet/Billing, Support, Profile/Settings (tab navigation)

2.2 Splash & Society Selection

Element	Detail
Society search	Text search + geofenced auto-suggest based on device location
Society not listed	"Notify me" capture: name, phone, society name/area — routed to B2B onboarding lead queue
Validation	Society must be in Active or Coming Soon status to proceed; Inactive societies hidden from search

2.3 Sign Up / Login

1. Input: 10-digit mobile number → "Send OTP" button.
2. OTP screen: 6-digit input, auto-read where supported, "Resend OTP" enabled after 30-second cooldown.
3. On verification: check if number exists → returning user goes to Home; new user goes to Profile Setup.

Validation: mobile number must be a valid 10-digit Indian number; OTP expires after 5 minutes; max 5 OTP attempts before temporary lockout (15 minutes).

2.4 Profile Setup

Field	Type	Required	Validation
Full Name	Text	Yes	Min 2 characters

Field	Type	Required	Validation
Flat/Unit Number	Text/Dropdown	Yes	Validated against society's registered unit list if available; else free text flagged for admin verification
Tower/Block	Dropdown	Conditional	Shown only if society has multiple towers
Alternate Contact	Phone	No	Valid 10-digit number if entered
Preferred Pickup Window	Multi-select (e.g., morning/evening)	No	Used to pre-filter slot suggestions

2.5 Home Screen

- Active subscription summary card: plan name, garments used/cap, days remaining in cycle.
- Primary CTA: "Schedule Pickup" (prominent button).
- Active order status strip if an order is in progress (tapping opens Order Detail).
- Quick links: Plans, Wallet, Add-on Services, Support.
- If no active subscription: Home shows plan comparison CTA in place of the subscription card.

2.6 Plans & Subscription

Screen	Key Elements
Plan Comparison	Card per tier (Basic/Standard/Premium/Family Pack) showing garment cap, turnaround time, price/cycle, "Select" CTA
Plan Detail	Full inclusions, add-on eligibility, billing cycle selector (monthly/quarterly), auto-renewal toggle (default ON)
Payment	Payment method selection (UPI/card/net banking/wallet), order summary, "Pay & Subscribe" CTA
Subscription Confirmation	Success state with plan summary; "Schedule your first pickup" CTA
Manage Subscription	View current plan, Upgrade/Downgrade (effective next cycle, shown with proration note), Pause (date range picker, capped days remaining shown), Cancel (reason dropdown + confirmation)

2.7 Schedule Pickup

4. Slot Selection screen: calendar/date picker + available time-slot list for the resident's society (slots reflect women's-unit or hub route capacity).
5. Recurring toggle: "Repeat this pickup" → day-of-week multi-select.
6. Special instructions text field (optional, e.g., fabric care notes).
7. Add-on selection (dry cleaning, shoe/bag cleaning, express delivery) inline before confirmation.

8. Confirmation screen: summary + "Confirm Pickup" CTA → triggers push/SMS confirmation.

Edge case: if no slots are available within the resident's preferred window, show next available slot across all windows rather than a dead end. If recurring slot becomes unavailable in a future week, notify resident proactively with a reschedule prompt.

Cancellation: "Cancel Pickup" available from Order Detail up to the configurable cutoff (e.g., 2 hours before slot); after cutoff, button is disabled with explanatory text.

2.8 Order Tracking

Status	Resident-Facing Label	Notification Sent
Scheduled	Pickup Scheduled	On booking
Picked Up	Garments Collected	On operator confirmation, with garment count
Processing	In Wash / Ironing	On stage transition (optional granular toggle in settings)
QC Hold	Quality Check in Progress	Only if QC fail — includes reason and next steps
Out for Delivery	On the Way	On dispatch, with live location map
Delivered	Delivered	On delivery confirmation, with itemized receipt link

- Order Detail screen: itemized garment list, status timeline, operator/agent contact (masked number), live map during "Out for Delivery," "Raise an Issue" CTA.
- Rate & Dispute: 5-star rating + optional comment after delivery; "Raise an Issue" opens a structured complaint form (issue type dropdown, photo upload, description) available within a 48-hour window post-delivery.

2.9 Wallet & Billing

- Wallet balance display, "Add Money" CTA, transaction history (credits/debits with order references).
- Invoice list with downloadable PDF per billing cycle.
- Saved payment methods management (add/remove UPI ID, card).

2.10 Support

- FAQ/help center (searchable).
- "My Tickets" list showing open/resolved complaints with status.
- New ticket flow: category selection, order linkage (optional), description, photo upload.
- In-app chat entry point (if live chat is implemented) or ticket-based async support for MVP.

2.11 Profile & Settings

- Edit profile fields, manage notification preferences (push/SMS/WhatsApp toggles per category).

- Language selection (English/Hindi at launch).
- Sustainability impact widget (optional): cumulative water saved through the resident's society's unit.
- Logout, account deletion request (per DPDP compliance).

3. Operations App — Screen-Level Specification

The Operations App serves two primary modes: Unit Mode (default, for women's-unit operators working within a single society) and Route Mode (for hub-model pickup/delivery agents and facility workers, used only in high-density clusters operating the centralized hub model). Login determines which mode loads.

3.1 Login & Daily Start

9. Login via mobile number + OTP or staff ID + PIN (configurable by deployment).
10. Unit Mode: lands on "Today's Bookings" screen scoped to the operator's society.
11. Route Mode: lands on "Today's Route" screen showing the assigned stop sequence.

3.2 Unit Mode — Today's Bookings

Element	Detail
Booking list	Grouped by time slot; each entry shows resident name (masked per privacy settings), flat number, pickup/delivery type
Status actions	Per booking: "Mark Picked Up" / "Mark Delivered" buttons
Garment logging	On "Mark Picked Up": opens garment entry screen (category + count fields, e.g., Shirts: 4, Trousers: 2, Bedsheets: 1)
QR tagging	After garment entry, app generates/prints or displays a QR batch code to physically tag the garment bag

3.3 Unit Mode — Processing Pipeline

12. Scan QR on batch arrival at the in-society processing point → status moves to "In Wash."
13. Operator manually advances status through Wash → Dry → Iron, each a single-tap action with optional timer (using the recipe-style timer pattern for wash/dry cycles).
14. QC screen: pass/fail toggle per batch; if Fail, mandatory reason dropdown (stain not removed, damage, fabric issue, other) + photo upload — this auto-creates a resident notification and a support ticket; batch cannot proceed to "Ready for Delivery" until QC is marked Pass or a documented exception override is approved by Admin.
15. Water usage entry (manual for MVP): liters used per cycle, or auto-populated if integrated machinery telemetry is available — feeds the Admin sustainability dashboard.

3.4 Unit Mode — Delivery

16. From "Ready for Delivery" queue, operator selects batch, scans QR to pull up the original pickup manifest.
17. App displays manifest count side-by-side with a re-count entry field — if counts mismatch, "Mark Delivered" is blocked and a discrepancy reason is required, auto-generating a support ticket.
18. Delivery confirmation: OTP entered by resident, or digital signature capture.

19. Order marked Delivered → resident notified, garment count deducted from subscription cap.

3.5 Route Mode — Today's Route (Hub Model)

- Optimized stop list grouped by building/tower with turn-by-turn navigation link per stop.
- Same garment-logging and QR-tagging flow as Unit Mode, applied per stop.
- Route completion summary: total stops, total garments collected, any flagged issues.

3.6 Hub Worker Mode (Hub Model)

- Incoming manifest queue: list of batches en route from all collection points.
- Scan-to-receive at hub; processing pipeline screens identical in structure to Unit Mode (Wash → Dry → Iron → QC).
- Outgoing dispatch queue: batches ready for the delivery route, grouped by route/agent.

3.7 Earnings & Performance (Unit Mode)

Element	Detail
Earnings summary	Current cycle: base draw amount, orders processed, performance-linked share accrued, projected payout
Performance metrics	Quality score (QC pass rate), on-time pickup/delivery rate, complaint count — visible to operator for transparency
Training access	Library of training videos/modules; refresher module completion tracking
Escalation	"Report an Issue" — equipment malfunction, supply shortage, safety concern — routed directly to Ops/Impact Manager

3.8 Offline Behavior

- All pickup/delivery/processing actions are cached locally if connectivity is unavailable and synced automatically on reconnect.
- Visual indicator (banner) when operating offline; queued actions shown with a pending-sync icon until confirmed synced.

4. Cross-App Notification Matrix

Event	Resident App	Operations App
Pickup booked	Confirmation push + SMS	New booking appears in Today's Bookings
Pickup completed	"Garments Collected" push with count	—
QC fail	"Quality Check" push + auto support ticket	Flag cleared once resident notified
Out for delivery	Push + live map	—

Event	Resident App	Operations App
Delivery completed	Push + itemized receipt	Earnings ledger updated
Discrepancy at delivery	Support ticket auto-opened, resident notified of investigation	Operator must log reason before proceeding

5. Validation & Error-State Summary

- All monetary fields: non-negative, two-decimal precision, currency-locked to INR.
- All phone number fields: 10-digit Indian mobile format, validated on blur.
- Garment count fields: non-negative integers only; zero allowed (e.g., add-on-only order with no standard garments).
- QR scan failures (damaged/unreadable code): manual batch-ID entry fallback, logged with a flag for Admin review.
- Network failure during payment: transaction status polled and reconciled before showing success/failure to resident — never assume success on timeout.

6. Open Items

- Final decision on masked vs. full resident contact visibility to operators (privacy vs. operational convenience trade-off).
- Whether QC override (proceeding despite a Fail) requires real-time Admin approval or can be operator-initiated with after-the-fact audit.
- Granularity of push notification settings exposed to residents (per-stage toggle vs. single on/off).
- Machinery telemetry integration timeline for automated water-usage logging vs. manual entry at MVP.
